

ENDOBOY 2017

Endoscope and instrument holder with pneumatic locking mechanism

It still has all the features and reliability you would expect, but **ENDOBOY2017** is a step forward, and will be essential to the future of 3D endoscopic vision.

ENDOBOY2017 is stable and rigid, and when used as an endoscope holder provides static images: all the benefits of 3D without the unpleasant sensations and visual fatigue. You and your team will work in greater comfort.

✓ more movement

The new more open and chamfered clevis saves weight and enables a wider range of movement than the previous version. The design of an off-centre sheath for an endoscope and instrument holder enables motions and surgical solutions that have hitherto not been possible.

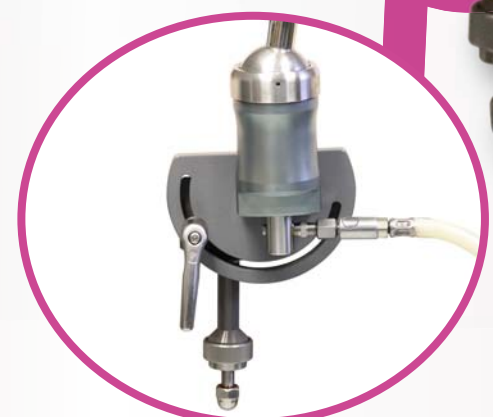

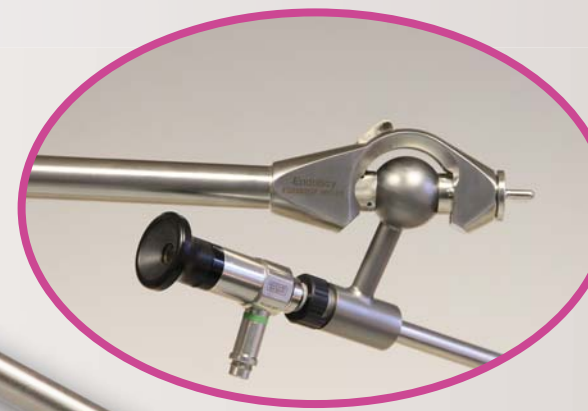

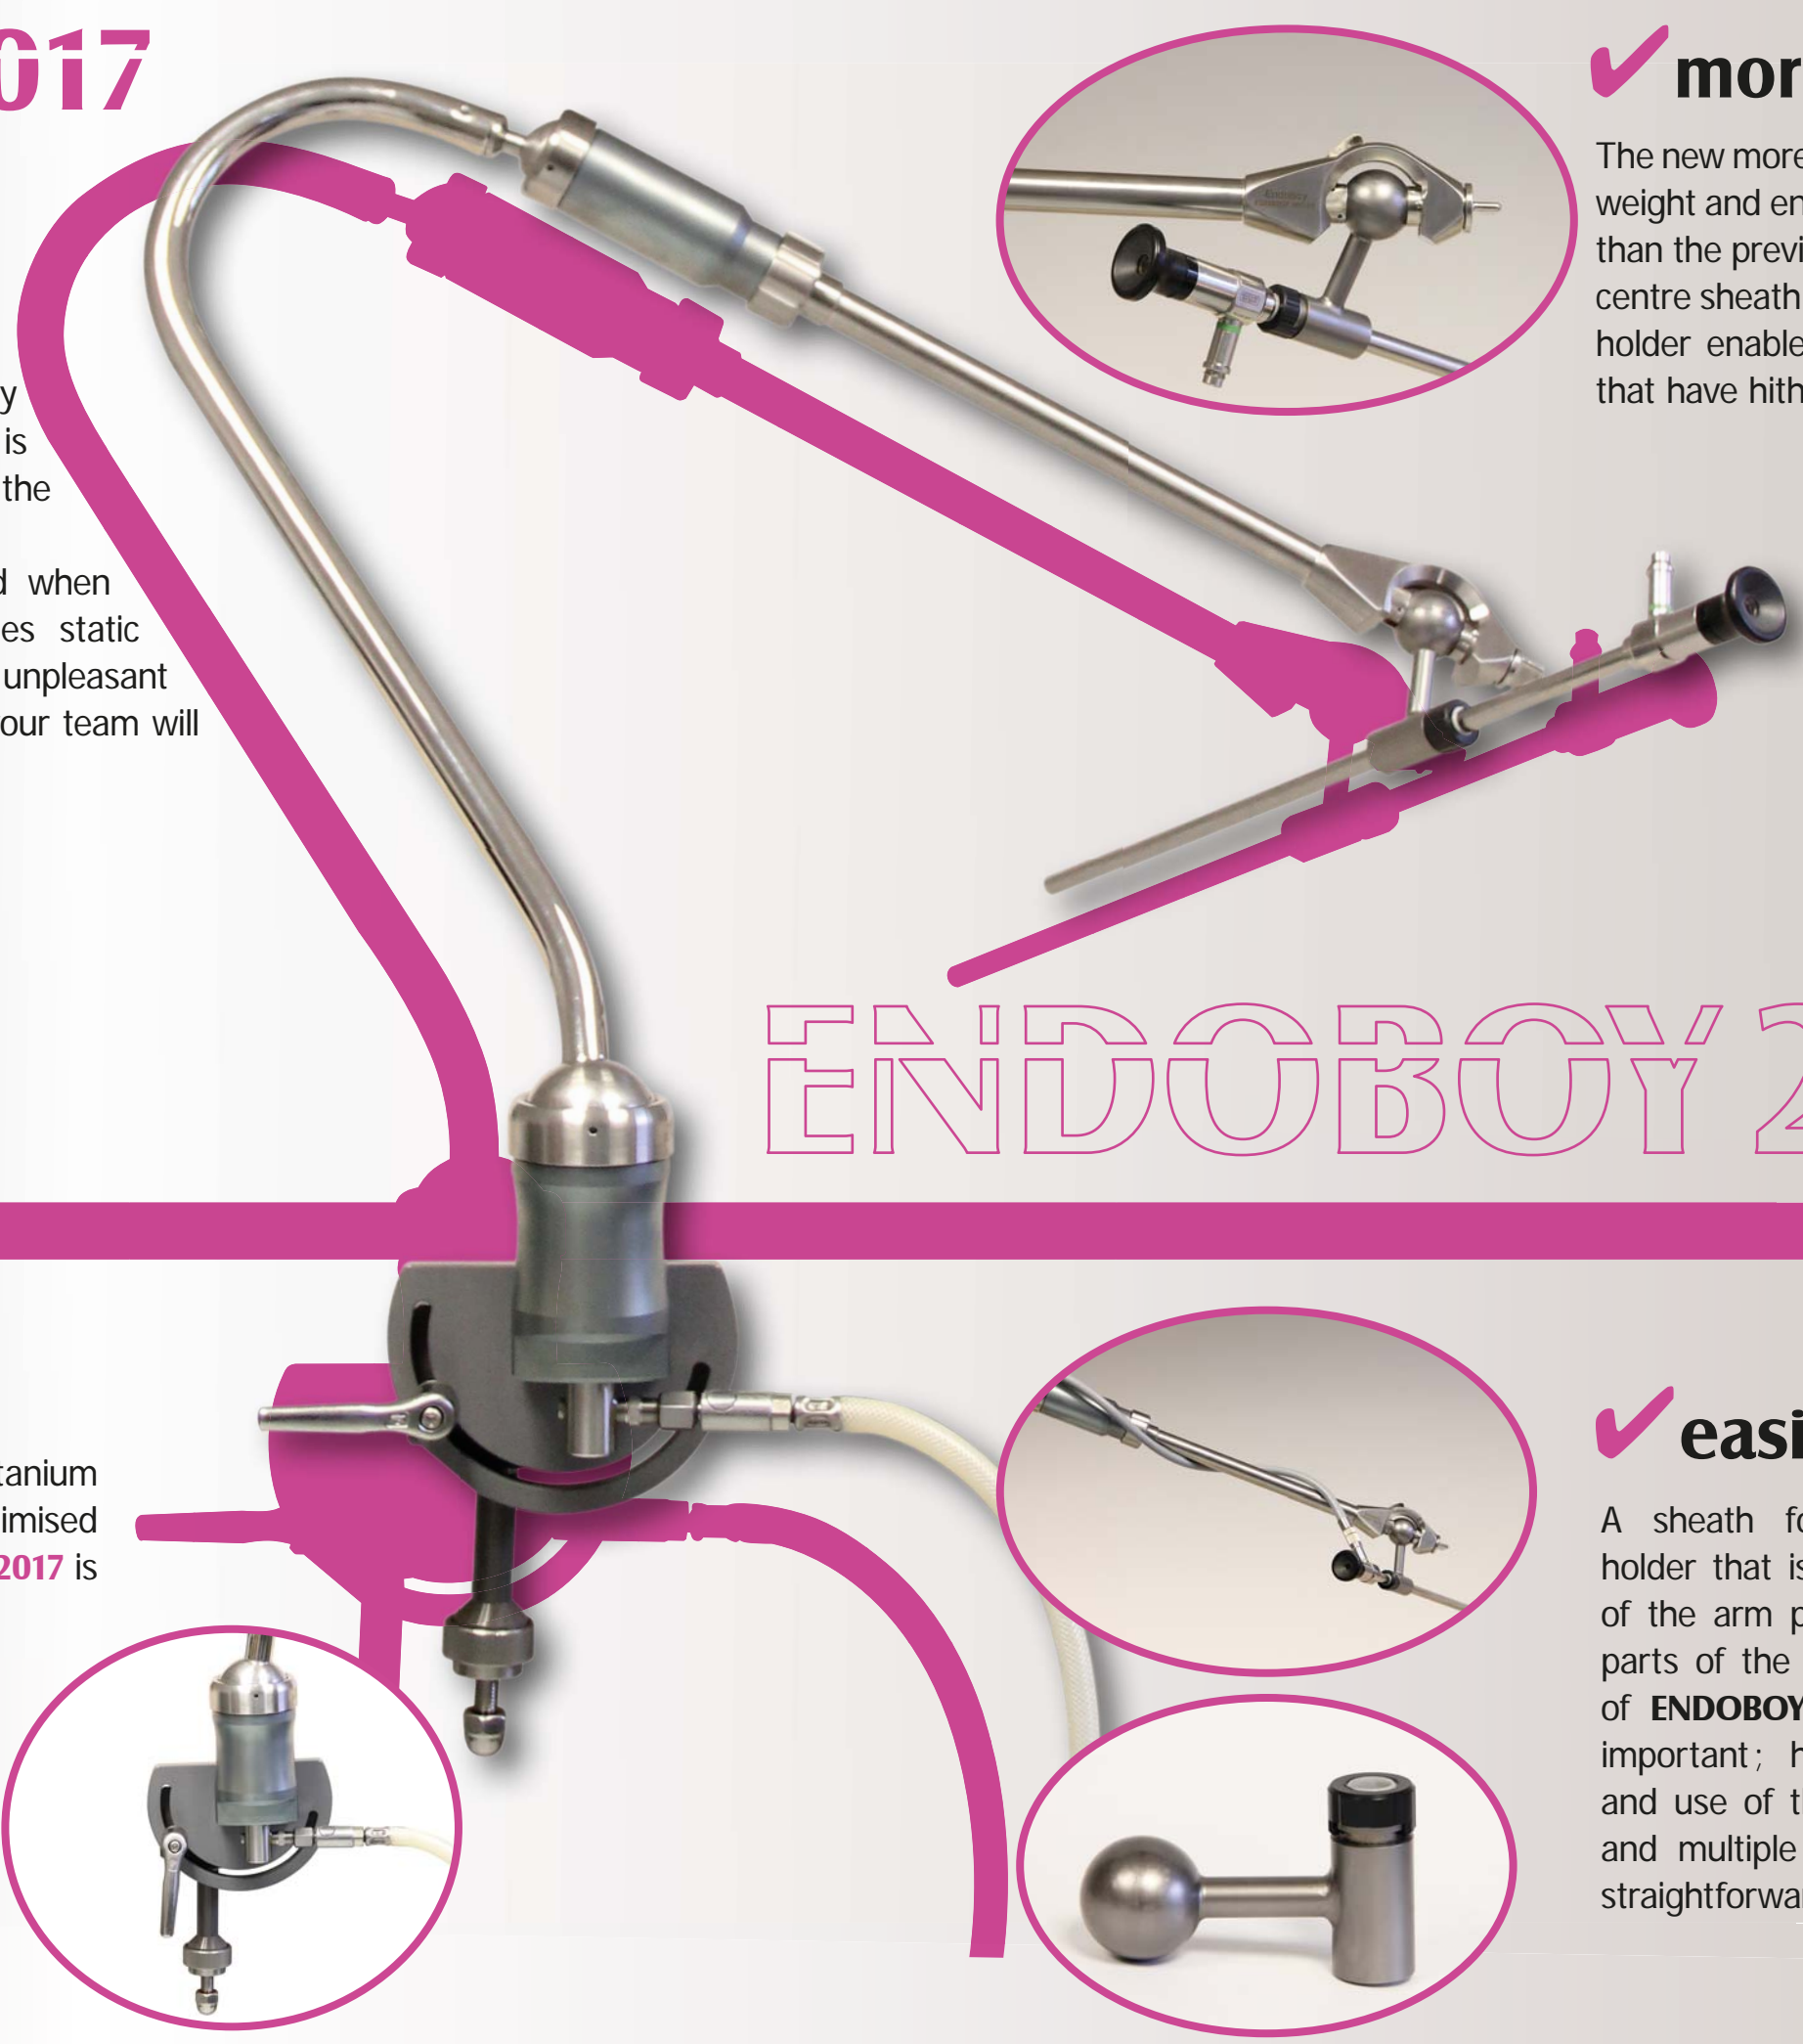

ENDOBOY 2017

✓ lighter

Weight-saving, with extensive use of titanium and technical polymers, and an optimised design for some components. **ENDOBOY2017** is easier to set up, clean and sterilise.

✓ easier to use

A sheath for endoscope and instrument holder that is off-centre from the distal joint of the arm provides complete access to all parts of the surgical site. The initial position of **ENDOBOY2017** on the table is now less important; handling and setup are easier, and use of the **ENDOBOY2017** arm in single and multiple trocar techniques is now very straightforward
